Pat,

ClanRend - It's not a bad material at all. Finer than WeberPral and (for some reason - don't ask me, ask the biochemists) mixes with a slightly higher water content though. Maybe quite similar to CPI's through-coloured render in final appearance, which I don't mind either now that they've sorted out the 'shrinkage' and retarded the mix. And nicer to use than K-Rend. Price is interesting: ClanRend on-site, delivered ... about £5.25 per bag. What's that? Nearly HALF the price of Weber!

Go for it. I've used it. You won't be disappointed.

Apparently it's discontinued now and they only do a thin coat acrylic system.

Wow! Is that so? I haven't dealt with them for some time now, but that's a surprise. If that's the case then, well it's still gonna be available under its brand-name Yedesa. Trouble is, you'd have to go all the way to Spain to get it! :laugh:

Oh well! :huh:

Oh, you'll certainly get impartiality every time (Read other posts) I'm a machine plasterer, not a salesman.

Monocouche render I personally rank in this order:

- 1) Weber pral
 - 2) Parex
 - 3) CPI
 - 4/5 Yedesa and Maxit
 - 6) K Rend
